MECA Applauds EPA Adoption of Tier 3 Rulemaking for Light-Duty Vehicles

Washington, D.C. – The Manufacturers of Emission Controls Association (MECA) today commended the U.S. Environmental Protection Agency (EPA) for adoption of a comprehensive rulemaking to reduce emissions of harmful pollutants from light-duty vehicles and to require the availability of low sulfur gasoline fuel. EPA’s Tier 3 motor vehicle emission and fuel standards program will create a national set of exhaust and evaporative emission standards for passenger cars and light-duty trucks starting with the 2017 model year by largely harmonizing the agency’s Tier 3 emission standards with California’s already-finalized LEV III emission standards, and will reduce the sulfur levels in gasoline from today’s 30 ppm average to a 10 ppm average across the nation by 2017.

MECA agrees with EPA’s assessment that achieving the Tier 3 exhaust and evaporative emission standards will be both technically feasible and cost-effective. This fact is clearly demonstrated by the more than two million SULEV (super ultra-low emission vehicle) and PZEV (partial zero-emission vehicle) light-duty vehicles that have already been sold in the U.S. since they were first introduced more than ten years ago. The technology base of advanced three-way catalysts, exhaust hydrocarbon adsorber materials, high cell density substrates, emission system thermal management strategies, secondary air injection systems, advanced carbon canisters, advanced low fuel permeation materials, and air intake hydrocarbon adsorber materials that have already been commercialized for PZEVs can be extended and further optimized to allow all light-duty gasoline vehicles to achieve the exhaust and evaporative emission reductions needed by vehicle manufacturers to comply with the Tier 3 emission standards. Furthermore, reducing sulfur in gasoline enables vehicle emission control technologies to perform more efficiently; thus, reducing gasoline fuel sulfur levels from the current 30 ppm national average to a 10 ppm average will ensure the use of the most cost-effective emission control options for future Tier 3 vehicles and will provide immediate reductions in emissions from the large, existing fleet of light-duty gasoline vehicles that travel America’s highways.

“EPA’s Tier 3 rule will provide a significant opportunity to further reduce emissions from the light-duty vehicle fleet by utilizing an integrated systems approach that combines advanced emission control technologies with advanced engine designs and very low sulfur gasoline fuel. In addition, these advanced emission control technologies will enable all current and future high-efficiency vehicle powertrains to be viable options for complying with EPA’s greenhouse gas pollutant standards,” said MECA’s executive director, Joseph Kubsh. “MECA congratulates the agency for all of its hard work in getting this important rule finalized and for its continued efforts in helping to achieve the goal of cleaner air for all Americans. Our industry is prepared to do its part to deliver cost-effective, advanced emission control technologies to the marketplace.”

Founded in 1976, MECA is a national association of companies that manufacture a variety of emission control technologies for cars, trucks, buses, and off-road vehicles and equipment, as well as stationary internal combustion engines.
